

## SOME ASPECTS OF FUTURE CONFLICT

**Peter Dimitrov**

**Abstract:** *The conflict is ubiquitous and ever present in human history. Mankind has not learned its lessons from the destructive consequences of all those wars but continues to create conditions for new conflicts to arise and spread their pernicious results all over the globe. The author argues that despite the fact that there is an enormous leap in social science and huge advance in technologies, and peoples understand the disastrous consequences of wars, there is no guarantee that conflicts will not happen nowadays and in future. The looks at contemporary geopolitical environment and global trends that are altering the world's status quo, draws conclusions from geopolitical, technological and social change and predicts that although there is not imminent danger of global war in future it is still possible in theory and practice.*

**Key words:** *androids, artificial intelligence, autonomous systems, climate change, cognitive domain, conflict, cyber-attacks, environment, globalization, guerilla warfare, human enhancement, hybrid warfare, information warfare, migration, nanotechnology, non-state actors, operations, quantum computing, science, technology, terrorism.*
